WHAT IS CLAIMED IS:

1. A method comprising:

detecting components of plaque using a multi-energy computed tomography (MECT) system.

2. A method in accordance with Claim 1 wherein said detecting the components of the plaque comprises:

generating a look-up table by using at least one simulated phantom, wherein the look-up table maps different densities of a selected basis material of the phantom to projection data for different energy spectra; and

obtaining the components of the plaque by using the generated look-up table.

3. A method in accordance with Claim 2 wherein said generating the look-up table comprises:

obtaining first and second sets of projection data of the phantom with a set of known material properties by:

placing the phantom in a scanning field of the MECT system; and scanning the phantom at first and second energy spectra using the MECT system.

4. A method in accordance with Claim 3 wherein said obtaining the components of the plaque comprises:

placing an object in the scanning field of the MECT system;

scanning the object at the first and second energy spectra using the MECT system to obtain projection data of the object;

enabling, utilizing the look-up table, the reconstruction of images of the distribution of densities of the object by reversely mapping the projection data of the object to

densities of the selected basis material, wherein the selected basis material includes at least one of iodine and water.

5. A method in accordance with Claim 2 wherein said generating the look-up table comprises:

obtaining projection data of the phantom with a set of known material properties by:

placing the phantom in a scanning field of the MECT system; scanning the phantom using the MECT system; counting photons generated from the scan; and distinguishing the photons based on an energy threshold.

6. A method in accordance with Claim 5 wherein said obtaining the components of the plaque comprises:

placing an object in the scanning field of the MECT system;

scanning the object using the MECT system to obtain projection data of the object;

enabling, utilizing the look-up table, the reconstruction of images of the distribution of densities of the object by reversely mapping the projection data of the object to densities of the selected basis material, wherein the selected basis material includes at least one of iodine and water.

- 7. A method in accordance with Claim 1 further comprising: performing additional scans of the object at different times; and repeating said detecting the components of the plaque.
- 8. A method in accordance with Claim 1 further comprising:

administering a contrast agent in at least one of lipid-avid agents, plaque specific antigens, and plaque cells; and

repeating said detecting the components of the plaque.

9. A method in accordance with Claim 1 further comprising:

administering a temperature-sensitive contrast agent in an inflamed plaque;

and

repeating said detecting the components of the plaque.

- 10. A method in accordance with Claim 1 further comprising:
- quantifying the components of the plaque.
- 11. A method in accordance with Claim 10 wherein said quantifying the components of the plaque comprises:

calculating composition distributions of the plaque; and calculating total plaque burden.

12. A method in accordance with Claim 1 further comprising:

displaying at least one of a 2-dimensional (2D) and a 3-dimensional (3D) image of the components of the plaque on a wall of an organ of the object; and

viewing, from a viewpoint, a volume of the plaque in the 3D image.

13. A method in accordance with Claim 1 further comprising:

improving quality of images of an object having at least one of metal stents and valves by removing beam-hardening artifacts in the images; and

enabling visualization of restenosis within at least one of the metal stents by repeating said detecting the components of plaque.

14. A method for detecting components of plaque comprising:

Express Mail No.: EV299866125US

generating information regarding projection data of phantoms by using a multi-energy computed tomography (MECT) system; and

obtaining the components of the plaque from the information.

15. A multi-energy computed tomography (MECT) system comprising:

at least one radiation source configured to transmit x-rays that intersect an object;

at least one detector configured to detect the x-rays;

a controller coupled to the detector; and

a computer configured to instruct the MECT system to detect components of plaque.

16. An MECT system in accordance with Claim 15 wherein to detect the components of the plaque said computer configured to:

generate a look-up table by using at least one simulated phantom, wherein the look-up table maps different densities of a selected basis material of the phantom to projection data for different energy spectra; and

obtain the components of the plaque by using the generated look-up table.

17. An MECT system in accordance with Claim 16 wherein to generate the look-up table said computer configured to:

obtain first and second sets of density distribution images of the phantom with a set of known material properties by:

simulating placement of the phantom in a scanning field of the MECT system; and

simulating a scan of the phantom at first and second energy levels using the MECT system.

Express Mail No.: EV299866125US

18. An MECT system in accordance with Claim 17 wherein to obtain the components of the plaque said computer configured to:

instruct the MECT system to place an object in the scanning field of the MECT system;

instruct the MECT system to scan the object at the first and second energy levels to obtain projection data of the object;

determine, from the look-up table, the densities of the object by reversely mapping the projection data of the object to the densities of the selected basis material, wherein the selected basis material includes at least one of iodine and water.

19. An MECT system in accordance with Claim 15 wherein said computer is configured to:

instruct the MECT system to perform additional scans of the object at different times; and

repeat the detection of the components of the plaque.

20. An MECT system in accordance with Claim 15 wherein said computer is configured to:

instruct a user to administer a contrast agent in at least one of lipid-avid agents of the plaque, plaque specific antigens of the plaque, and plaque cells of the plaque; and

repeat the detection of the components of the plaque.

21. An MECT system in accordance with Claim 15 wherein said computer is configured to:

instruct a user to administer a temperature-sensitive contrast agent in an inflamed plaque; and

repeat the detection of the components of the plaque.

Express Mail No.: EV299866125US

22. An MECT system in accordance with Claim 15 wherein said computer is configured to:

quantify the components of the plaque.

23. An MECT system in accordance with Claim 22 wherein to quantify the components of the plaque said computer configured to:

calculate composition distributions of the plaque; and calculate total plaque burden.

An MECT system in accordance with Claim 15 wherein said computer is configured to:

instruct a display device to display at least one of a 2-dimensional (2D) and a 3-dimensional (3D) image of the components of the plaque on a wall of an organ of the object; and

enable viewing, from a viewpoint, a volume of the plaque in the 3D image.

25. An MECT system in accordance with Claim 15 said computer is configured to:

improve quality of images of an object having at least one of metal stents and valves by removing beam-hardening artifacts in the images; and

enable visualization of restenosis within at least one of the metal stents by repeating said detecting the components of plaque.

- 26. A computer readable medium encoded with a program configured to instruct a computer to detect components of plaque within an object that is scanned using a multi-energy tomography (MECT) system.
- 27. A computer encoded with a program configured to instruct an MECT system to detect components of plaque within an object that is scanned using the MECT system.
